

Alejandro González Macías

Junior Backend / Full-Stack Developer

Computer Engineering graduate (Software Engineering) from the University of Seville, with a final degree project graded 9.4/10. Practical experience building REST APIs, recommendation systems with embeddings and LLMs, and real-time communication (WebSockets) in projects using Python/Django, Java/Spring Boot, C#/.NET and NestJS. I work with Docker and CI/CD, and experience with Scrum in a team of 20+ people. I want to join a team where I can contribute quality code and keep growing.

SKILLS

- **Languages:** Java, C#, Python, JavaScript, TypeScript.
- **Backend:** Django, FastAPI, Spring Boot, NestJS, .NET, REST APIs, JWT, WebSockets.
- **Frontend:** React, Angular, React Native, Tailwind CSS.
- **Real time:** WebSockets, Socket.IO.
- **AI & data:** Embeddings, vector and semantic search, collaborative filtering, recommender systems, LLM integration, scikit-learn.
- **Databases:** PostgreSQL, SQL, Redis, Neo4j (graph).
- **Testing:** pytest, JUnit, xUnit, Jest.
- **DevOps:** Git, Docker, Docker Compose, GitHub Actions, CI/CD.
- **Methodologies:** Scrum, Agile.

LANGUAGES

Spanish: Native

English: C1 Advanced (Cambridge English)

OTHER

- Driving licence: B

EDUCATION

BSc in Computer Engineering – Software Engineering

University of Seville, Seville — 09/2022 – 07/2026

Final degree project: UltimateWatch – **Grade: 9.4/10**

PROJECTS

Ukinory – AI movie recommendations *(personal)*

Demo: ukinory.vercel.app | Code: github.com/xultimatex8/ukinory

- Designed a hybrid recommender combining semantic embeddings, vector search and collaborative filtering, adapting to ratings and swipes, with personalised explanations generated by an LLM (Gemini).
- Built an import and enrichment pipeline (Letterboxd, TMDb, Wikidata) with caching, batch processing, retries with backoff and rate-limit handling.
- Implemented guest sessions that convert into accounts and real-time shared rooms (WebSockets with polling fallback), caching LLM results by hash.

Stack: Python/Django, TypeScript/React, Tailwind CSS, PostgreSQL, Redis, pytest, Docker, GitHub Actions, CI/CD.

UltimateWatch – Real-time social platform *(thesis, academic)*

Code: github.com/xultimatex8/UltimateWatch

- Developed solo, following Scrum, a full-stack app with NestJS, Socket.IO and PostgreSQL: rooms with a synchronised timer, real-time chat, voting and role-based permissions.
- Integrated the TMDb and Watchmode APIs into a single catalogue and redesigned the database inheritance strategy when the project was already advanced.

Stack: TypeScript/NestJS, Socket.IO, TypeScript/React, Tailwind CSS, PostgreSQL, Jest.

UltimateGGx – League of Legends match analysis *(personal)*

Demo: ultimateggx.vercel.app | Code: github.com/xultimatex8/UltimateGGx

- Reconstructed each match's state (KDA, gold, level, inventory) from Riot API events, deriving metrics the API does not expose.
- Built, with C#/.NET and Angular (new technologies for me), an interface with a synchronised timeline, minimap and scoreboard.

Stack: C#/.NET, TypeScript/Angular, Tailwind CSS, PostgreSQL, xUnit, Docker, GitHub Actions, CI/CD.

Zeolite – Graph-based story editor *(academic)*

Code: github.com/AdrianChabrera/zeolite

- Contributed to a FastAPI, Neo4j and React app that models fictional universes as a graph, and implemented queries that detect inconsistencies (characters without interactions, isolated locations).

Stack: Python/FastAPI, Neo4j, TypeScript/React.

KeaKit – Item and service rental platform *(academic)*

Code: github.com/KeaKit/KeaKit

- Developed the ratings module, contributed to the incidents and price-calculation modules, and refactored and fixed bugs, in a team of 20+ people using Scrum.

Stack: Java/Spring Boot, TypeScript/React Native, PostgreSQL, JUnit.
